

Maloperation of Relay Protection

Overview

This paper provides detailed technical analysis of several catastrophic relay misoperations and demonstrates how to prevent them from occurring. Understanding the operation and importance of the SOTF feature is essential for engineers tasked with maintaining the integrity. Relay with reach setting ZAB for line between stations A & B may operate for faults beyond bus B. The relay is set to operate without any delay for faults up to 80-85% of the protected line section impedance, ZAB. This is also called Under reaching zone or Zone1 15-20% of the remaining line section. With high penetration of distributed generation (DG) into distribution systems, an unintended bulk DG tripping as a consequence of severe disturbances such as 3-phase faults in the transmission system is a concern since it can further cause unintended operation of transmission distance relays. An undesired overall. Abstract - Distance relays are critical in safeguarding the electrical grid by detecting faults and maintaining system stability and reliability.
